

SEPTEMBER

2026

COOL-SEASON LAWNS

Fall is the best time to feed cool-season lawns (fescue, bluegrass, rye) with **ferti•lome Winterizer**. This September fertilizing will help grass thicken up and grow after summer's stress. Give your soil a boost by applying **ferti•lome HuMic** in conjunction with this first application of Winterizer.

If "dry" areas of turf pull up easily—grubs may be the cause. There is still time to control grubs with **BioAdvanced 24-Hour Grub Killer Plus**. Water this product in well. Continue to be on the lookout for another generation of armyworms. If spotted, treat again with **ferti•lome Spinosad** or **Hi-Yield Bug Blaster II** with Bifenthrin in liquid forms, or granular products such as **Hi-Yield Bug Blaster Plus Above/Below** or **Hi-Yield Turf Ranger II**. Be sure to follow label directions.

September through mid October is the time to reseed or overseed cool-season grasses. Good seed-to-soil contact is essential for successful overseeding. You can achieve this by working the soil with a cultivator, vertislicer or garden rake. Get everything else you need to seed in our **Premium Seeding Package**. It includes **Johnson's Blue Ribbon Tall Fescue Blend** grass seed, **ferti•lome New Lawn Starter**, **ferti•lome Winterizer** and **ferti•lome HuMic**.

SPRING-FLOWERING BULBS

Start planting spring flowering bulbs like crocus, daffodils, hyacinths and tulips now. You can plant for the next few months but shop now for the best selection.

When planting bulbs make sure your soil is fertile and drains well. Add **Cotton Burr Compost** to loosen the soil. Use **Hi-Yield Bulb Food** in the bottom of the planting hole or mixed into the bed area. Plant the bulbs according to directions—planting depth varies from bulb to bulb. A good rule of thumb, however, is approximately 2½ times the width of the bulb. After planting, water in your bulbs thoroughly with **ferti•lome Root Stimulator** for fast root development.

FALL COLOR

For a show of fall color, we have an excellent selection of chrysanthemums and pansies. After planting, water them in with **ferti•lome Root Stimulator**.

Our winter-hardy pansies come back in the spring to bloom with your bulbs. To help pansies flower now and to build them up for the winter, use **ferti•lome Premium Bedding Plant Food** or a slow release food like **ferti•lome Garden Cote 6** when planting; then water with **ferti•lome Root Stimulator**. Mulch well after planting and water occasionally through the winter if the weather is dry.

TREES and SHRUBS

Nursery stock that is planted in the fall has two cool seasons (fall and spring) to get established before having to deal with the heat and drought of Kansas summers. When planting, use **ferti•lome Start-N-Grow** and **MYKE Tree and Shrub** in the planting hole. MYKE is a beneficial fungus which attaches to the roots making them more vigorous and promotes the long range health of the plants. Then water with **ferti•lome Root Stimulator**. Mulch newly planted trees and shrubs to help retain soil moisture and to keep soil temperature even through winter. Stake new trees for no more than one calendar year to allow the root system to establish.

Fall is the best time to feed established trees and shrubs. This feeding will do more good than anything to help plants come out healthier next spring. Be sure and water through fall and winter if weather is dry. Apply **ferti•lome Tree & Shrub Food** to the soil surface around your plants and water in thoroughly. Fine tree roots extend far beyond the drip line, so apply Tree & Shrub Food well beyond that point.

For plants prone to insect damage use **ferti•lome Tree & Shrub Systemic Insect Drench** in conjunction with **ferti•lome Tree & Shrub Food** for up to twelve months of protection.

HOUSE PLANT CARE

If your house plants have been summering outside, start a pest control program to keep unwanted insects from hitching a ride into your house and infesting other plants. Spray plants a couple of times with **ferti•lome Triple Action** or **ferti•lome Indoor/Outdoor Multi-Purpose Insect Spray** to make sure plants are free of pests. Spray the soil as well as the plant itself. If you have a lot of plants, use **Hi-Yield Indoor/Outdoor Broad Use Insecticide** concentrate. Dilute it to water through the soil to take care of any ants or other pests. On pest prone plants, like hibiscus, also put **Hi-Yield Systemic Insect Granules** in the soil to protect for 2 months. Water monthly with **ferti•lome All Purpose Water Soluble Plant Food 20-20-20** to maintain good color.

NUISANCE PEST CONTROL

As fall approaches, crickets, spiders and other insects start looking for winter homes. To keep these pests from selecting your home, spray **Hi-Yield Indoor/Outdoor Broad Use Insecticide** in a band around your foundation as well as around windows and doors. **Hi-Yield Turf Ranger** granules can be used around the foundation and into the yard to control nuisance insects. For pest control indoors use **Spider Traps**. For larger pests, use **Mouse Magic** to naturally repel and keep mice on the outside.
